

Current Happenings—Week of May 3, 2021

Well Redevelopment and Carbon Changeout

To keep our treatment system operating smoothly, we periodically perform routine operation and maintenance (O&M) tasks. For reference, please see the treatment system flow illustration on the home page.

During the week of May 3, we'll execute the following O&M tasks:

- **Well redevelopment:** At select extraction wells, we'll clean the well screens to help improve pumping efficiency. Because this is an outdoor process, you may notice additional equipment onsite.
- **Carbon changeout:** Some of the tanks in our interior treatment system contain granular activated carbon (GAC). We'll remove this carbon from select tanks and replace it with regenerated carbon. We'll then ship the removed carbon off-site for regeneration. Once it's regenerated, it'll be returned to us for future use—a key element of our sustainability measures. With the exception of a transport vehicle parked near the facility, this is an indoor process.

We'll work with experienced contractors for both O&M tasks. These contractors provide specialized equipment that will allow us to perform these processes safely and efficiently.
